20. ABSTRACT (Continue on reverse side if necessary and identify by block number) Based upon self-reported descriptions and using the height-weight tables of the Metropolitan Life Insurance Company, a sample of Air Force enlisted personnel, broken down by race and sex, were classified as either overweight (OW), average weight (AW), or underweight (UW), and weights upon entrance into the service were compared with weights after entrance into the service. Further, food preferences were assessed. The majority of the male respondents were OW while the majority of female respondents were AW, and more females than males were concerned about their weight. Approximately 25% of the OW males became OW within the first 2 years of service,

and OW respondents with a meal card tended to have gained more weight than OW respondents without a card. Meat items were among the high preference foods of the OW while fruits were among the high preference foods of the AW and UW. Seventeen of the foods for which significant preference differences were obtained were preferred more by the OW than the UW, and 13 of these were meat or entree items. Overweight females as well as OW males exhibited a greater preference than did the UW for meats and entrees. Overweight respondents also indicated a greater preference for low calorie soda. Other preference differences indicated that lighter weight respondents preferred fruits and desserts more than did the OW. Females were the most likely to report using dieting methods to lose weight.

## Preface

This study was conducted by the Behavioral Science Division, FSL, of the Natick Research and Development Command in response to United States Air Force Requirement 7-6, Prediction of Food Habit Changes in the USAF. It was conducted at Travis Air Force Base, CA.

Special acknowledgement and thanks are due to Mr. Peter Priori, whose support and enthusiastic assistance in the analysis of the data made this report possible.

### The USAF FOOD HABITS STUDY: Part III, Weight Gain and Food Preferences of the Overweight

The present report is the third in a series of three reports concerned with the food habits of Air Force personnel. The first report was concerned largely with method and overview (Wyant, Meiselman and Waterman, 1979);<sup>1</sup> the second was concerned with the food preferences of blacks and whites and males and females (Wyant and Meiselman, 1979).<sup>2</sup> A fourth report focusing on food selection, the number of servings selected, and the perceived size of a serving is anticipated. The present report focuses on body weight gain and the food preferences of individuals grouped into three weight categories. Based upon self-reported weights, respondents were classified as either overweight (OW), average weight (AW), or underweight (UW) using the height-weight tables prepared by the Metropolitan Life Insurance Company. Weights indicated by the tables are associated with lowest mortality according to insurance company data. The study was designed to collect data pertinent to establishing the number of individuals who were overweight by race and sex, the amount of weight gained while in the service, and possible sources of weight gain. We were, for example, interested in knowing whether more weight was gained by individuals who had a meal card than by those who did not. The food preferences of the individuals who participated in the study were assessed using a nine-point hedonic scale that enables the respondent to indicate how much he likes a food and a preferred frequency scale that allows the respondent to indicate how often, in days per month, he would like to eat the food (Peryam, Polemis, Kamin, Eindhoven, and Sidel, 1960; Moskowitz, Nichols, Meiselman, and Sidel, 1972).<sup>3,4</sup>

## Method

All respondents were classified upon the basis of reported weights as either OW, AW, or UW using the medium frame column of the height and weight tables compiled by the Metropolitan Life Insurance Company. It was assumed that most people report their heights not including the height of the heels of their shoes and weights not including the weight of their clothing. The Metropolitan tables, however, report data for males wearing one inch heels and six pounds of clothing and data for females wearing two inch heels and four pounds of clothing. The tables consequently were adjusted. For males, one inch was subtracted from the tabled height values, and six pounds were subtracted from the lower and upper limits of each weight interval of the medium-frame column. Two inches were subtracted from the tabled height values, and four pounds were subtracted from the lower and upper limits of the weight intervals for women. For girls between 18 and 25, one pound was subtracted for each year under age 25.

The occurrence of OW, AW, and UW respondents and the concern of respondents about their weight was established by constructing contingency tables. Similarly, the use of dieting methods and desired menu changes were also established using contingency tables. Chi squares and eta values were found whenever possible in order to establish significance and the strength of the relationship. In addition, a number of t tests for dependent samples were performed on the differences between the weights of respondents upon entrance into the service and weights of the same respondents after they had been in the service for two years or less. The t tests were performed to establish the amount of weight gain in the service and possible sources of weight gains.

The analysis of preference differences among the weight groups was made in four steps. First, foods were ranked by decreasing hedonic mean and by decreasing frequency mean. Second, a one-way (either OW, AW, or UW) analysis of variance was performed on the ratings of each food. Tukey's test was performed whenever significance was obtained in order to identify the means between which differences occurred. As sample sizes were unequal (for sample sizes, see Tables 6 to 8), some of the results were expected to be spurious. Third, the 200 foods were categorized into 31 food groups, and an average score for each category was found. An analysis of variance was performed on the averaged scores for each of the categories. Fourth, the 31 food categories were used in two discriminant analyses to differentiate among the weight groups. For a more detailed description of the analysis see Wyant et al. (1979).<sup>5</sup>

## Results

### The Occurrence of OW Before and After Entrance Into the Service and Concern for Weight

The percent and number of each of the subpopulations who were classified as either OW, AW, or UW and the percent and number who were concerned about their weight are given in Table 1. Approximately 44% of all respondents were classified as OW, 39% as AW, and 17% as UW. The majority of males were classified as OW while the majority of females were classified as AW, and more females were classified as UW than were males ( $\chi^2(6) = 95.29, p < 0.001, \eta = 0.37$ ). White males, 63.7%, were more frequently classified as OW than any of the other three groups. White females, 20%, were the least frequently classified as OW. Of the BM, 57.6% were classified as OW, and 26.9% of the BF were classified as OW.

About 52% of all respondents were concerned about their weight. Sixty-four percent of the OW were concerned, 45% of the AW were concerned, and 35% of the UW were concerned. More women than men were concerned about their weight ( $\chi^2(3) = 18.88, p < 0.001, \eta = 0.17$ ), and though more men than women were classified as OW, more OW women were concerned ( $\chi^2(3) = 23.91, p < 0.001, \eta = 0.31$ ). Only 53.1% of the OW white males were concerned about their weight, while 84.6% of the OW white females were concerned. Generally, white males were the least concerned about their weight, and white females were the most concerned, though black females were not far behind.

Avowed concern for present weight among overweight WM, WF, BM, and BF and among the AW appeared related to weight classification. Among the groups making up OW personnel, high frequencies of concern were associated with low frequencies of OW personnel. Among the AW, the relationship was positive; high frequencies of concern were associated with high frequencies of average weight personnel. The more a group (i.e., either WM, WF, BM or BF) was concerned about weight, the lower the occurrence of OW individuals and the greater the occurrence of AW individuals.

We found, then, that the majority of males were OW while the majority of females were average weight, and fewer males than females were concerned about their weight.

Data relevant to establishing whether personnel became OW while in the service or whether they were OW prior to entering the service is given in Table 2. Provided in the table is the percent of each group who were either OW, AW, or UW upon entrance into the service and the percent increase or decrease of respondents classified as either OW, AW, or UW after they had been in the service for a period of up to 2 years. Results suggest that some respondents did become OW while in the service. The percentage of respondents who were UW upon entrance into the service decreased by 16.6%. The percent of females who were AW increased by 6.8%, but the percent of males who were AW decreased by 6.6%. Finally, the percent of respondents who were OW increased by 17.3%.

Of the 43.7% who were classified as OW, 26.4% were OW prior to entering the service, and 17.3% became OW after entering the service. Note, however, that the percentage of males who became OW is much larger. Of the white males who were classified as OW, 25.5% became OW while on active duty. Of the 57.6% of black males who were OW, 25.4% became OW while on active duty. Some of this weight gain, however, was probably due to increased muscle tissue. A much smaller percent, 8.8%, of the females became OW after entrance in the service.

These results indicate that weight was gained by respondents after they had entered the service, that a significant percentage of personnel classified as OW became OW while in the service, and that a much greater number of males became OW than females. We do not know, however, whether respondents would have gained weight had they not been in the Air Force but rather had, for example, been attending a school.

#### **Amount of Weight Gained and Possible Sources of Weight Gain**

Data summarized in Table 3 provides an indication of how much weight was gained by the sample of AF personnel. Provided in the table are the mean present weights (i.e., weights at the time of the survey), mean past weights (i.e., weights upon entrance into the service), and the mean differences between present and past weights per group and for each of the classifications OW, AW, and UW. Values of t for differences between past and present means are also given. The table is further broken down into those who received rations-in-kind and those who did not. We assumed that those who received rations-in-kind were likely to have eaten in the dining halls more frequently than those who did not receive rations and that consequently the effect on weight gain of eating in the dining halls could be isolated. Data was restricted to the responses of personnel whose years of service were two or less.

Results indicated that during the first two years of service, respondents gained an average of four pounds. Four to eight pounds were gained by OW personnel, an average of four pounds was gained by AW personnel, and zero to four pounds were gained by UW personnel. Underweight females either tended to maintain their weight, perhaps gaining several pounds, or lost weight. With the exception of UW individuals, the weights of personnel after entrance into the service also tended to be less variable than upon entrance.

While we were interested in knowing whether people tended to gain weight after entrance into the service, we also wanted to know whether personnel who received rations-in-kind and who were likely to eat in the dining halls gained more weight than those who did not receive rations.

The results, indicated in Table 3, for UW and AW personnel were not clear. Of the UW personnel who did not receive rations-in-kind, women tended to maintain their weight, perhaps gaining slightly, while men tended to gain weight (6.5 lb for black males and 8.44 lb for white males). Of the UW personnel who received rations-in-kind, we

only have sufficient data for white females who tended to maintain their weight. There were too few respondents in each of the other categories.

The average number of pounds gained by AW personnel who did not receive rations-in-kind was the same as that gained by those who received rations (4.21 lb), and the receipt or nonreceipt of rations-in-kind did not appear to differentially affect the weight of white females who were AW. But blacks who received rations-in-kind appeared to have gained more weight than blacks who did not. There were too few white male respondents to warrant a comparison.

Clearer results were obtained for respondents classified as OW. Overweight personnel who received rations-in-kind gained an average of 8.34 lb. An average of 4.95 lb was gained by OW personnel who did not receive rations-in-kind. These results characterized each of the subgroups. When OW personnel are classified as either white or black or either male or female, group sizes are somewhat more substantial, and we are provided with another look at the possible effects of receiving rations-in-kind. These data are given in Table 4. Again, it is apparent that those OW respondents who received rations-in-kind and who were likely to eat in the dining halls tended to gain more weight than those who did not. Also note that a significantly greater number of people who received rations were OW (47.7%) than were AW (38.2%) or UW (14.4%) ( $\chi^2(2)=8.20$ ,  $p=0.017$ ,  $\eta^2=0.11$ ). The data are given in Table 5. These results are consistent and indicate an association between the occurrence of OW and the receipt of rations.

#### Ten Most Preferred Foods

Foods were first ranked per group by decreasing hedonic mean and second by decreasing preferred frequency mean. These data are provided in Tables 6–8 for the OW, AW, and UW respectively and are accompanied by standard deviations and sample sizes. Common among the ten most preferred foods of each group were grilled steak, milk, orange juice, tossed green salad, ice cream, and buttered whole kernel corn. The three most preferred foods of OW and AW individuals were grilled steak, milk, and orange juice. Grilled steak and orange juice were also among the three most preferred foods of UW individuals. Milk, however was ranked ninth; tossed green salad was ranked first. This difference likely reflects the fact that a greater number of females than males were UW and that while males were observed to have selected more milk than did females, females avowed a greater preference for tossed green salad. The most marked differences for high preference food were the greater preponderance of meats or entree items among the high preference foods of the OW individuals and a greater preponderance of fruits among the foods preferred by AW and UW individuals. Roast beef, fried shrimp, fried chicken, and ham were among the 10 most preferred foods of the OW personnel but not among the preferred foods of AW and UW personnel, and oranges, peaches, and watermelon were high preference foods of AW and UW personnel but not of OW personnel.

## Preference Differences for Individual Food Items

Provided in Tables 9 and 10 are the results of the one-way (either OW, AW, or UW) analyses of variance performed on the ratings of the 200 food names. In Table 9, food items are grouped into 31 food categories, and the categories are arranged in the order in which a meal is normally served beginning with appetizers and ending with desserts. Presented in Table 10 are only the food names for which significant preference differences were obtained. The foods preferred by OW personnel are presented first and are followed by a listing of the foods that were preferred by the AW.

Results given in Table 10 indicate that significant preference differences were obtained for 26 of the 193 foods (13.5%). Of the 26 foods, 17 (65%) were preferred more by OW respondents than by AW or UW respondents. Eight foods were preferred more by AW respondents, and only 1 food item, coconut raisin cookies, was preferred more by UW respondents. Thus while there was a small percentage of foods for which preference differences were obtained, differences indicated that the OW respondents liked the food the most, the UW, the least, and the AW somewhere in between.

Twelve (71%) of the 17 foods preferred more by the OW than the UW were meats or entrees containing meats. The meat preferences of the AW were more like that of the OW than the UW, but while they tended to exhibit a preference for meats, it was not nearly as strong as that of the OW. On the other hand, AW respondents tended to prefer fruits more than the OW. Significant preference differences were obtained for fruit cup, fresh peaches, and oranges.

Because a substantially larger number of males than females were OW, the marked preference of the OW for meats may have reflected food preferences of OW males but not of OW females. Consequently the analysis was repeated exclusively on the data of female respondents. Significance was achieved for 7 of the 11 meats and the direction of the means was in agreement for 3 others. Moreover, OW women indicated that they liked, significantly more than UW women, burritos, submarine sandwiches ( $p=0.065$ ), tuna salad sandwiches, and baked tuna and noodles. Both OW men and women, then, tended to prefer meats and entree items more than did the UW respondents. Note also that OW women preferred fried rice ( $p=0.085$ ), steamed rice, brown rice, and several vegetables, as for example, green beans ( $p=0.056$ ), lima beans, and lentils.

The preference of the OW for meats is consistent with data reported by Meiselman (1977) who calculated a somatotype ponderal index for each of approximately 4000 military respondents who were then classified into the groups overweight, slightly overweight, slightly underweight, and underweight. Results indicated that heavier young men preferred entree items more than lighter young men but did not want them served more often. Results also indicated that the lighter young men preferred fruits more than the heavier men and wanted them served more often. An analysis of food classes also indicated that the light respondents preferred fruit. Respondents were also classified into overweight, normal, and underweight groups using the Metropolitan Life Tables. Heavier

individuals again exhibited a clear preference for entree items. When the lighter groups were defined by the Metropolitan Life Tables, however, they did not indicate a preference for fruits.

### **Food Categories and Discriminant Analyses**

Scores were also averaged within food categories, but an analysis of the data produced few significant results. Generally, however, meat classes were given the highest ratings by the OW respondents. These data are provided in Table 11.

Also given in Table 11 are the mean ratings for five dessert classes. Meiselman found that when weight classes were defined using that somatotype ponderal index, the lighter respondents indicated a much greater preference for desserts and wanted them served more often. Similar results, however, were not obtained when weight classes were defined using the Metropolitan Life Tables. Results given in Table 11, on the other hand, indicate that the average weight respondents preferred desserts more than the OW respondents even though OW women indicated a greater preference for sweet potato pie ( $p=0.057$ ), soft serve ice cream, and milk shakes. Further support is provided by the results of the discriminant analyses which are presented in Table 12. In the analysis of the OW, AW, and UW groups, results indicated that the AW and UW more than the OW preferred the food classes puddings and other desserts and ice cream and sherbert ( $\chi^2(10)=42.14$ ,  $p<0.001$ ,  $r$  canonical=0.24), and results of the analysis of the OW and the AW indicated that the AW more than the OW preferred ice cream and sherbert ( $\chi^2(4)=22.40$ ,  $p<0.001$ ,  $r$  canonical=0.21). These results are consistent with the majority of Meiselman's findings and, at least, suggest that AW respondents tended to indicate a greater preference for desserts.

Results of both discriminant analyses indicated that the OW preferred stews and extended meats and carbonated beverages more than the lighter respondents. The former food class reflects the OW's preference for meats while the latter, their preference for low calorie soda. Significant preference differences were also obtained for the averaged ratings of the food class carbonated beverages, and near significant results were obtained for the food class beer, which was preferred by the OW, and fruit, which was preferred by the AW and UW.

Collectively, the results of the various analyses indicate that on the average the OW respondent indicated a greater preference for meats, entrees, and low calorie soda than did the UW respondents while the AW respondents tended to indicate a greater preference for fruit and desserts.

### **Suggested Menu Changes and Dieting Methods**

Respondents were asked to indicate how the dining facility could alter their menu in order to aid in personal weight control programs. For each of seven types of food,

as, for example, meats, respondents could suggest that more of a food should be served, that fewer foods of a kind should be served, that a greater variety of the food should be served, or that the quantity and variety was "OK as is." The percent of each of the groups who suggested each of the four kinds of changes is given in Table 13. The most frequently requested changes regardless of group classification were for more or different meats, fewer vegetables, and different potatoes.

A greater percentage of the OW than AW requested more desserts, but a greater percentage of the UW than the OW requested more desserts. These results, however, were not statistically significant. A significantly greater percentage of the UW than the OW and AW, on the other hand, requested more salads while a greater percentage of the OW requested fewer salads ( $\chi^2(6)=15.53$ ,  $p=.016$ ,  $\eta=.13$ ).

Notice that with the exception of drinks and breads, the majority of the OW and AW made the same menu change suggestions. But with the exception of breads, the percent of OW respondents requesting more in each category tends to be greater than the percent of AW respondents. And the percent of the OW requesting fewer items in each category tends to be less than that for the AW, with the exception that the OW more frequently requested fewer salads. Note also that UW respondents more frequently than OW respondents requested more potatoes and drinks as well as more salads and desserts.

The percent of individuals out of each group who indicated they used each of five dieting methods is presented in Table 14. All groups indicated that the most frequently used dieting method was to eat less at meals. The least likely dieting method to be chosen by all groups except black males was to eat more to gain weight. While black males indicated they were the most likely to use this method, white females indicated they were the least likely ( $\chi^2(3)=16.64$ ,  $p<0.001$ ,  $\eta=0.16$ ). Either white or black females were the most likely to use each of the other four methods (no longer eat certain foods,  $\chi^2(3)=23.62$ ,  $p<0.001$ ,  $\eta=0.19$ ; skip meals to lose weight,  $\chi^2(3)=17.21$ ,  $p<0.001$ ,  $\eta=0.16$ ; cut out between meal snacks,  $\chi^2(3)=7.42$ ,  $p=0.060$ ,  $\eta=0.11$ ; cut down amount eaten at meals,  $\chi^2(3)=21.53$ ,  $p<0.001$ ,  $\eta=0.18$ ).

## Conclusions

1. The majority of males were overweight while the majority of females were average weight, and more females than males were concerned about their weight.
2. Of all overweight respondents, 17% became overweight within the first two years of service. Twenty-five percent of the males became overweight. Some of the weight gain may have been due to increased muscle tissue.
3. An average of 4 lb was gained by all personnel. We do not know, however, whether respondents would have gained weight had they not been in the Air Force.
4. Overweight respondents with meal card tended to gain more weight than personnel who did not receive rations-in-kind.
5. Four meat items were among the ten most preferred foods of the overweight but not among the ten most preferred foods of the average weight or underweight; three fruit items were highly preferred by the average weight and underweight but not by the overweight.
6. Preference differences among the overweight, average weight, and underweight were found for 26 (13%) of the 193 foods. Of the 26 foods, 17 (65%) were preferred more by the overweight than by lighter individuals.
7. Overweight males and females preferred meats, entrees, and low calorie soda more than did the underweight, and lighter respondents tended to prefer fruits and desserts more than did the overweight.
8. Females indicated they were more likely to use dieting methods to lose weight.

\*Percents of total group size are in parentheses.

### Table 3

Provided in Table 3 are the mean reported weights of personnel per group (either white males, white females, black males, or black females) upon entrance into the service, the mean reported weights per group at the time of the survey, and the difference between the two. These data are given for each of the three weight classifications, beginning with OW and ending with UW, and for the group of respondents who possessed a meal card and received rations and the group who were on BAS and did not receive rations. Values of  $t$  for dependent samples and strength of association measures are also reported for group sizes of eight or more. Groups were restricted to those personnel whose time in service was two years or less. Standard deviations are given in parentheses.

**TABLE 3**

**Overweight Personnel**

	<b>Mean Present Weight</b>	<b>Mean Weight Entered</b>	<b>Mean Difference</b>	<b>Group Size</b>	<b>Value of t</b>	<b>Two Tail Probability</b>	<b>Proportion of Variability Accountable</b>
<b>Did Not Receive Rations</b>							
White Males	176.77 ( 18.68)	174.77 ( 23.21)	2.00 (10.64)	30	1.03	0.312	0.
White Females	140.12 ( 12.81)	123.12 ( 41.97)	17.00 (32.14)	8	1.50	0.178	
Black Males	166.78 ( 13.61)	161.21 ( 15.71)	5.57 ( 6.47)	14	3.22	0.007	0.40
Black Females	136.33 ( 11.85)	132.00 ( 8.66)	4.33 ( 3.21)	3			
Median Mean Difference			4.95*	63			
<b>Received Rations</b>							
White Males	170.84 ( 12.19)	164.28 ( 13.37)	6.56 (11.14)	25	2.94	0.007	0.23

Black Males				0			
Black Females	111.50 ( 11.79)	117.75 ( 6.90)	-6.23 (10.60)	4			
All Respondents	125.38	126.19	-0.81	27			

#### Table 4

Given in Table 4 are the mean reported weights of OW white respondents, OW black respondents, OW males, and OW females upon entrance into the service, the mean weights of these groups at the time of the survey, and the mean difference. As in Table 3 these data are provided for the group of individuals who received rations and the group of individuals who did not receive rations, and groups were restricted to those personnel whose time in service was two years or less. Values of  $t$  and strength of association measures are also given. Standard deviations are in parentheses.

TABLE 4

Mean Reported Weights of the OW Upon Entrance and After Entrance into the Service for Meal Card vs. Subsistence Allowance, Black vs. White, and Male vs. Female

	Mean Present Weight	Mean Weight Entered	Mean Difference	Group Size	Value of t	Two Tail Probability	Proportion of Variability Accountable
<b>Did Not Receive Rations</b>							
Whites	169.05 ( 23.10)	163.90 ( 34.80)	5.16 (17.96)	38	1.77	0.085	
Blacks	161.41 ( 17.64)	156.06 ( 18.48)	5.35 ( 5.97)	17	3.70	0.002	0.43
Males	172.50 ( 17.08)	168.26 ( 21.68)	4.24 (10.56)	50	2.84	0.007	0.12
Females	147.85 ( 35.51)	127.00 ( 33.23)	20.85 (36.76)	13	2.04	0.063	0.20
<b>Median Mean Difference</b>			5.26*				
<b>Received Rations</b>							
Whites	158.68 ( 20.64)	151.62 ( 21.10)	7.05 ( 9.71)	40	4.59	0.000	0.34
Blacks	157.65 ( 18.78)	147.80 ( 19.30)	9.85 (11.01)	20	4.00	0.001	0.43
Males	169.68 ( 13.04)	162.10 ( 17.12)	7.58 (12.81)	40	3.74	0.001	0.24
Females	136.82 ( 13.15)	129.48 ( 12.54)	7.33 ( 6.93)	27	5.50	0.000	0.52
All Respondents	155.71	147.75	7.95				

\*Note that a median rather than a mean is given here due to the likelihood of an extreme weight value being reported by a white female.

Table 5

The Percent of Individuals Who Either Received or Did Not  
Receive Rations and Who Were OW, AW, or UW

	Over- weight	Average Weight	Under- weight	Total
Percent Who Received Rations	47.4	38.2	14.4	100.0
Number Who Received Rations	197	159	60	416
Percent Who Did Not Receive Rations	38.6	38.6	22.8	100.0
Number Who Did Not Receive Rations	83	83	49	215

### Tables 6–8

Two ranked listings of the 200 foods are provided in Tables 6–8 for OW, AW, and UW personnel, respectively. The first listing in each table is ranked by decreasing hedonic mean; the second listing is ranked by decreasing preferred frequency mean. Mean hedonics and frequencies are accompanied by standard deviations, sample sizes, and the percent of all respondents who never tried, and the percent who have tried, each of the foods.

### Table 9

Reported in Table 9 are the results of the one way (either OW, AW, or UW) analyses of variance performed on the ratings of the 200 food names. Food items are grouped into 31 food categories, and the categories are arranged in the order in which a meal is normally served, beginning with appetizers and ending with desserts. In the first three columns are the ranks, food names, and food identification numbers respectively. Ranks are arranged by overall decreasing hedonic mean. Given in the next six columns are the mean preference ratings and the rank order of each rating of each food per group. Significant differences occurring among the three groups are indicated in the following column, headed strength of association, by the correlation coefficient eta. Eta is a measure of the strength of the relationship between the weight factor and the preference ratings, and larger values of eta indicate stronger relationships. An asterisk in one of the last three columns indicates a significant preference difference was obtained between the groups indicated by the heading of the column in which the asterisk is found.

### Table 10

The results of the analyses of variance performed on the ratings of those foods for which significant preference differences were obtained are provided in Table 10. Foods that were preferred more by OW personnel were categorized into two groups and are listed first. They are followed by a listing of foods that were preferred more by AW personnel. In the first three columns are the ranks, food names, and food identification numbers respectively. Given in the next six columns are the mean preference ratings and the rank order of the mean ratings per group. As before, significant differences occurring among the three groups are indicated in the next column by the correlation coefficient  $\eta$ , and an asterisk in one of the last three columns indicates a significant preference difference was obtained between the two groups indicated by the heading of the column in which the asterisk is found.

FOOD ITEMS FOR WHICH SIGNIFICANT PREFERENCE DIFFERENCES AMONG THE OW, AW, AND UW WERE OBTAINED
